

PROJECT NEXUS · BT WHOLESALE

Hub Reference vs. Nexus PRD — Gap Analysis

Mapping what the existing Hub portal already proves against what the Nexus PRD requires, with design decisions that need resolving before build.

Source A: Hub Manage User Walkthrough (video, Jun 2026) **Source B:** Nexus PRD v<draft>

Scope: Access, Onboarding & RBAC (UC4–12) + Product Enablement

The Hub walkthrough covered one squad's in-progress work on user account management — **not a complete feature-equivalent of Nexus**. It is useful as proof of interaction patterns and as a baseline for understanding what the current state is, but Hub was not designed with the Nexus role model, sub-reseller hierarchy, or API-first principle in mind. Use it as a **reference for UX patterns**, not as a build baseline.

4

Use cases with reusable Hub patterns

5

Partially covered — Hub pattern needs extending

7

Not covered — no Hub equivalent observed

Access & Onboarding UC4 – UC8

USE CASE	WHAT HUB SHOWS	GAP / WHAT NEXUS NEEDS	COVERAGE
UC4 Customer Establishment (Reseller)	- Account (tenant) is pre-created by BT ops before users log in - Primary contact is set at account creation and becomes default admin	- Hub does not show a self-serve reseller establishment flow — it is BT-initiated - Nexus PRD requires automated, end-to-end onboarding with minimal BT manual intervention → Decide: fully self-serve signup vs. BT-initiated with self-serve completion step	PARTIAL

USE CASE	WHAT HUB SHOWS	GAP / WHAT NEXUS NEEDS	COVERAGE
UC5 Sub-Reseller Establishment	Not shown. Hub walkthrough only covered users within a single account, not nested organisations.	- Nexus requires Reseller Admins to onboard sub-resellers independently - Sub-resellers must inherit product access scoped by the parent reseller - No Hub pattern to reference — needs fresh design → Decide: who approves sub-reseller creation — Reseller Admin only, or BT co-approval?	NOT COVERED
UC6 Organisation Hierarchy	Single-tenant model only. Account → Users. No hierarchy depth shown.	- Nexus requires BT → Reseller → Sub-Reseller hierarchy with cascading visibility rules - Hub's flat model is a different paradigm — not extensible to this without rearchitecting → Decide: maximum hierarchy depth, and whether commercial data (pricing) is always masked below reseller level	NOT COVERED
UC7 User Onboarding (Self-Serve)	- Admin adds user: name, email, phone, role, permissions - Email invite sent automatically with registration link - User sets password on first login - Deactivate / reactivate flow exists - Remove user detaches from account (account persists)	- Hub pattern is directly reusable for the add-user flow — strong reference - Hub doesn't show bulk user import (required in Nexus for high-volume partners) - Primary contact reassignment before removal not surfaced in Hub UI → Decide: does Nexus need a user import via CSV/API at MVP, or post-MVP?	REUSABLE
UC8 BT Internal Users	Not demonstrated. Walkthrough was conducted from a	Nexus needs BT Admins to create and manage reseller accounts, and BT Users	NOT COVERED

USE CASE	WHAT HUB SHOWS	GAP / WHAT NEXUS NEEDS	COVERAGE
	reseller admin perspective only.	(AMs) to shadow partners in a view-only assisted mode No Hub reference for this — separate internal access model needed → Decide: single portal with role-based internal/external views, or separate internal tool?	

Identity, Authentication & RBAC UC9 – UC12

USE CASE	WHAT HUB SHOWS	GAP / WHAT NEXUS NEEDS	COVERAGE
UC9 Identity & Authentication	- Email + password authentication observed - Registration via email invite link	- Hub does not show SSO, MFA, or federated identity — all required in Nexus PRD - API Consumer authentication (OAuth 2.0, client credentials) not present in Hub at all → Decide: SSO provider strategy for portal users, and whether API auth shares the same IdP	PARTIAL
UC10 Permission Set Management	- Permissions assigned per user at creation ("based on what they need") - Appears to be a checkbox-style selection — no named permission set templates shown	- Nexus requires reusable, named permission sets that can be applied across users and maintained centrally - Hub's per-user permission assignment doesn't scale to high user volumes → Decide: should Reseller Admins be able to create custom permission sets, or only choose from BT-defined templates?	PARTIAL
UC11 Role Definition & Assignment	Two role levels observed: account-level admin (primary contact only) and portal-level admin	Hub's two-tier role model is far simpler than Nexus's requirement for: Reseller Admin, Reseller User, Sub-Reseller Admin, Sub-Reseller	PARTIAL

USE CASE	WHAT HUB SHOWS	GAP / WHAT NEXUS NEEDS	COVERAGE
	Regular user is the default	User, BT Admin, BT User, API Consumer Hub does not support cross-organisation role assignment (e.g. Reseller setting permissions for Sub-Reseller users) → Decide: whether roles are fixed (BT-defined) or configurable by Reseller Admins within boundaries	
UC12 RBAC Enforcement	App Protects section shows product-level access gates — clicking a product takes user to its ordering page only if enabled.	- Hub's enforcement is product-level only (can you access this product?) - Nexus requires operation-level enforcement (can you place vs. view vs. cancel orders on this product?) - Sub-reseller access must be scoped by the parent reseller's own permissions — Hub has no delegated RBAC → Decide: enforce RBAC at API gateway layer, portal layer, or both?	PARTIAL

Product Enablement & API Consumer

APP PROTECTS · API PLATFORM

AREA	WHAT HUB SHOWS	GAP / WHAT NEXUS NEEDS	COVERAGE
App Protects Product discovery & access	- Product list with enable status - Arrow → links to product ordering page - Enablement driven by Sales/CESS, not self-serve	- Nexus aims to make product enablement self-serve or at least transparent — Hub relies on BT back-office - Nexus must support bundling (e.g. broadband as product category), which Hub doesn't model → Decide: can resellers self-enable products in Nexus, or is BT approval always required?	PARTIAL
API Consumer Developer onboarding	Not present in Hub. Hub is a UI-only portal; no API developer tooling, sandbox, or documentation observed.	- Full API developer experience (sandbox, docs, tutorials, analytics) is a major Nexus deliverable with no Hub equivalent - API onboarding should be integrated with portal onboarding — SSO linking the two is a prerequisite → Decide: single unified portal including API docs, or separate developer portal with SSO bridge?	NOT COVERED
Documents Content repository	A "Documents" link exists in the user profile area but was untested — scope unclear to the walkthrough participants.	- Nexus requires a CMS-managed, RBAC-controlled document repository (product handbooks, service plans) - Hub's documents section may be a starting reference but its current scope is unknown — needs investigation → Decide: CMS platform choice for Nexus content authoring (UC14)	PARTIAL
Contact Prefs Profile & notification	Contact preferences section in user profile — but not set up during	Nexus requires notification/subscription preferences as part of the	PARTIAL

AREA	WHAT HUB SHOWS	GAP / WHAT NEXUS NEEDS	COVERAGE
settings	onboarding, only discoverable post-login.	comms and briefings journey (UC20) Hub's post-login-only pattern creates a discoverability problem — users may never find it → Decide: surface notification preferences during onboarding, or treat as a secondary profile setting?	

Design Decisions to Resolve Before Build

DECISION 01

How automated is reseller onboarding — truly self-serve, or BT-initiated with self-serve completion?

Hub requires BT ops to create the account before any user can log in. Nexus targets automated onboarding as a core success metric. The answer shapes the entire UC4 journey and the internal BT Admin tooling scope.

MUST RESOLVE AT DISCOVERY

DECISION 02

Single portal with internal/external role views, or a separate BT internal tool?

Hub was not observed supporting BT colleagues. Nexus PRD says BT Admins and AMs use "the same portal experience as partners." Maintaining one codebase reduces cost but increases RBAC complexity significantly.

MUST RESOLVE AT DISCOVERY

DECISION 03

Are roles BT-defined and fixed, or can Reseller Admins customise within bounds?

Hub only supports two tiers. Nexus needs seven distinct personas. Allowing resellers to customise roles adds flexibility for large partners but dramatically increases the permission management surface area.

MUST RESOLVE AT DISCOVERY

DECISION 04

Unified portal including API developer tools, or separate dev portal with SSO bridge?

The PRD leans toward integration ("API onboarding as part of product onboarding"), but a separate dev portal is operationally simpler and a common industry pattern. This decision affects the SSO architecture.

RESOLVE BEFORE ALPHA

DECISION 05

RBAC enforced at API gateway, portal layer, or both?

DECISION 06

Can resellers self-enable products, or is BT approval always required?

Nexus's API-first principle suggests the gateway is the source of truth. Portal-layer enforcement is defensive but creates a risk of drift between the two. A dual-enforcement approach doubles the maintenance surface.

RESOLVE BEFORE ALPHA

Hub routes enablement through Sales/CESS. The PRD's self-serve goal implies resellers should be able to activate entitled products without raising a ticket. This has commercial and credit risk implications BT must sign off on.

RESOLVE BEFORE ALPHA

DECISION 07

Is bulk user import (CSV or API) in MVP scope?

Large resellers will have dozens of users to onboard at once. Hub has no bulk import. The PRD mentions bulk ordering but is silent on bulk user import specifically. Clarifying this prevents last-minute scope creep.

RESOLVE BEFORE BETA

DECISION 08

Should notification preferences be collected during onboarding or left as a post-login setting?

Hub surfaces contact preferences only after login, which reduces discoverability. Moving it into onboarding improves briefing subscription rates but adds friction to a flow the PRD wants to keep fast.

RESOLVE BEFORE BETA
